Adam and Eve cast out of Paradise.

## EXIT from EDEN

**A search through geological and fossil records for a seminal moment in time that forever altered the course of human history.**

“Therefore the LORD God sent him forth from the garden of Eden, to till the ground from whence he was taken.” Genesis 3:23

*By Thomson Lawrie, Grimsby, Ontario*

In the winter of 1932 as the world was sinking ever deeper into the misery of The Great Depression, the Cayce family gathered together with Edgar Cayce’s secretary, Gladys Davis, and family friends for a remarkable series of readings that would reveal a story

of a much darker time in the Earth’s history. As bad as things were in the winter of 1932, they could never compare to the tragedy that had already befallen mankind in the mists of a long forgotten past. All had been lost. Some two hundred thousand years of human civilization had vanished beneath the ocean waves. The few who survived would journey to the Pyrenees, Egypt and the land of the Incas, while others became the mound builders of America. Thousands of years would go by. Eventually all that would remain were the stories passed down from one generation to another of a great land that long ago sank beneath the waves of an ocean that still bears its name. This was the lost continent of Atlantis or as Cayce called it, “the Eden of the world.” (364-4)

According to Cayce, Atlantis was an island continent that was about the size of Europe. It was located in the mid Atlantic Ocean and was situated between the Gulf of Mexico on one side and the Mediterranean on the other.

Atlantean civilization spanned the time from 200,000 BC to 9,500 BC.

Cayce tells us that even though the rise and fall of Atlantis took place in the distant past their society had been far more technically advanced than our own.

However, despite their advancements, the Atlanteans had misused their power and brought about their own destruction by awakening the forces that had been laying dormant deep within the Earth. The Cayce readings tell us “there came then the first of the destructive forces as could be set and then be meted out in its force or power. Hence that as is termed, or its first beginning of, EXPLOSIVES that might be carried about, came with this reign, or this period.” (364-4) Unfortunately, the Atlanteans had not foreseen the potential danger of what they were unleashing. As Cayce explains it “man brought in the destructive forces as used for the peoples that were to be the rule, that combined with those natural

Continued from page 1

resources of the gases, of the electrical forces, made in nature and natural form the first of the eruptions that awoke from the depth of the slow cooling earth, and that portion now near what would be termed the Sargasso Sea first went into the depths.” (364-4) The explosive forces that the Atlanteans unleashed caused an unanticipated upheaval in the Earth’s molten core that led to a portion of the continent sinking into the depths of the ocean. Once the power of the Earth was released it was beyond their technology to stop it. “Then with the breaking up, producing more of the nature of large islands, with the intervening canals or ravines, gulfs, bays or streams.” (364-6) These remaining islands would eventually break up as well causing the greatest civilization that man had ever known to vanish beneath the ocean waves.

Why had the Atlanteans unleashed such lethal force? What were they trying to accomplish? Cayce explains that “there were the invasions of this continent by those of the animal kingdoms, that brought about that meeting of the nations of the globe to PREPARE a way and manner of disposing of, else they be disposed of themselves by these forces.” (364-4) In other words their continent was being inundated by hordes of wild animals. They planned to use “those elements that would produce destructive forces, as might be placed in various quarters or gathering places of those beasts, or the periods when the larger animals roved the earth - WITH that period of man’s indwelling.” (364-6) A past life reading given for a young man in 1944 sheds a little more light on the subject. He was told that he had been “in the Indian land or in those periods of Saad as the leader, the ruler” where “the entity was then what would be called the secretary of state” ... “The entity then was among those who were of that group who gathered to rid the earth of the enormous animals which overran the earth, but ice, the entity found, nature, God, changed

the poles and the animals were destroyed, though man attempted it in that activity of the meetings.” (5249-1)

What kind of animals could have been such a threat to the Atlantians? Cayce uses the term “enormous animals” and “larger animals” stating “MEN, then - began to cope with those of the beast form that OVERRAN the earth in many places.” (364-4) The dinosaurs were certainly enormous animals but they have been extinct for 65 million years. They vanished from the Earth long before man’s “indwelling”, as Cayce put it. These

***“Cayce tells us that the records of Atlantis will someday be uncovered in the Hall of Records buried under the foot of the great sphinx in Egypt. When that happens we will have the complete story ... The destruction of an entire continent must have left some trace in the geologic records of the Earth. The question is, where would you even begin to look?”***

readings could only have been referring to the giant mammals that inhabited the planet during the Atlantean period. During this time the Earth was home to many species of giant mammals that have long since become extinct (see illustration on page 4). Europe, Africa, Australia, North America and South America were all once populated by animals that make the most ferocious of contemporary beasts seem tame by comparison. The fossil record shows that mastodons, woolly mammoths, saber tooth tigers, camels and giant sloths were among the many species of large animals that inhabited our own

North American continent in the time of Atlantis. The North American short faced bear once stood an incredible 12 feet tall standing on its hind legs. All of these enormous animals had survived for millions of years but the last of these giants disappeared around 11,000 years ago as the last ice age was coming to an end. It’s small wonder that the Atlanteans would have feared such beasts but these animals had been on the Earth from the earliest days of Atlantis. Why had they suddenly become such a problem? Why had they risked so much to destroy them at this particular time?

Cayce tells us that the records of Atlantis will someday be uncovered in the Hall of Records buried under the foot of the great sphinx in Egypt. When that happens we will have the complete story but until then should we just take this story on faith alone? Surely there must be some other evidence of such an enormous event. The destruction of an entire continent must have left some trace in the geologic records of the Earth. The question is, where would you even begin to look? Perhaps you would begin where the most information on Atlantis is currently found, the Cayce readings.

Reading 5249-1 provides us with three pieces of information about this particular time in history. The subject of the reading was told that he had been “among those who were of that group who gathered to rid the earth of the enormous animals which overran the earth” but “ice, the entity found, nature, God, changed the poles and the animals were destroyed”. These three things surrounded the events described by Cayce: a destruction of large animals, ice and a pole shift. This reading suggests that a large destruction or extinction of giant mammals was brought about by a sudden temperature drop or movement of ice formations. This sudden climate change also happened at the same time as a shift in the Earth’s magnetic poles. If we can find these three elements in the planet’s geological and fossil records then we may be able to find this moment in time. We’ll begin with the pole shift.

Continued on page 3

Continued from page 2

## Pole Reversals – The Earth’s Unstable Past

When the first mention of pole shifts came through the Cayce readings in 1933 there was almost nothing at all known about previous reversals of the Earth’s magnetic poles. Earth’s magnetic fields have reversed hundreds of times throughout the life of the planet, turning north into south and south into north only to flip again reversing the whole process. After a pole reversal a compass which once pointed North would now point South instead but we don’t really know what kind of turmoil a pole reversal would create for the creatures living on the surface of the planet while this was happening. The timing of pole reversals has been erratic throughout history but it is estimated that they have happened every 450,000 years on average. None of this was known during Edgar Cayce’s lifetime which makes it all the more remarkable that he would start talking about shifting of the Earth’s poles back in 1933.

It was first noticed in the 1920’s that some volcanic rocks had developed a magnetic charge that was opposite that of the Earth but it was not known why. During the 1930’s and 40’s while the Cayce readings predicted a shift in the Earth’s

magnetic poles in the near future and spoke of polar shifts in the past, there was no scientific literature to support these claims. It wasn’t until the late 1950’s and early 60’s that enough evidence would be gathered to support any such possibility. The development of the electronic magnetometer in the 1950’s was about to change that

Oil companies found it useful to map the weak magnetism of rocks to discover oil deposits. A magnetometer was sensitive enough that it could explore large areas while suspended from an airplane. While this was useful for oil exploration it didn’t add much to our understanding of how the magnetic orientation of volcanic rocks was formed. Rocks on land seemed jumbled in their magnetic orientation. However, this picture changed dramatically around 1960 when ships started to be equipped with magnetometers. The floor of the Atlantic Ocean revealed a surprising difference. The ocean floor was arranged in long even strips of magnetic rock running roughly north and south on either side of the mid-Atlantic Ridge.

The mid-Atlantic Ridge is an area of high volcanic activity that runs down

*The mid-Atlantic Ridge*

the centre of the Atlantic Ocean. Submarines exploring this area have observed lava oozing from the ocean floor. The striking thing about these magnetic rock formations on either side of the mid-Atlantic Ridge is that they are matched by rock formations on both sides. A wide or narrow strip of rock on one side of the ridge has an equivalent wide or narrow strip in the same position on the opposite side. Strips in the same position on either side of the ridge have the same magnetic orientation. One strip of rock that matches the Earth’s present magnetic field is followed by one that opposes it. The next one is a match for the

Earth’s magnetism and the next opposes it and so on and so on. These rock formations on the floor of the Atlantic Ocean have formed a permanent record of each polar reversal down through the ages. The discovery of an orderly arrangement of magnetized rock along the ocean floor was compelling evidence that the Earth’s magnetic poles had reversed at times in the past but just how these strips of volcanic rock had formed along the ocean floor in the first place was still a mystery. It would take another piece of the puzzle before the whole picture could be seen. The missing piece was called the theory of Continental Drift.

### **ONTARIO EVENTS: Youth and Adult Outdoor Retreat - Huntsville, Ontario August 2-5, 2013.**

Celebrate the Cayce experience and fellowship of likeminded individuals and families for 4 days and 3 nights on the grounds of the rustic, historic Portage Inn owned by authors of *Edgar Cayce, An American Prophet*, Sidney & Nancy Kirkpatrick. Enjoy evening talks by the Kirkpatricks and Cayce volunteers, communal dinners, bonfires, sing-alongs and activities, like meditation, stretches, dream sessions, talks, workshops, talent show, sports, hiking, games and more.

Outdoor camping and limited indoor accommodations are available. **To Register call 1-866-322-8209 ext 718**

Continued from page 3

## Continental Drift – Our Slowly Evolving Planet

**B**ack in 1918 a German geophysicist and Arctic explorer named Alfred Wegener first noticed that the coastline of South America and Africa matched each other in the same way he had seen ice flows break apart and retain the shape of the original ice flow that they had broken from. He theorized that continents, like ice flows, floated on deeper layers beneath them and that over millions of years the internal heat of the earth provided the energy that slowly drove the continents apart. Wegener's theory encountered enormous resistance from the scientific community in 1918. The world was still no closer to accepting his ideas by the time of his death in 1930. It would be another 30 years before the discoveries of magnetic patterns on the ocean floor would provide the missing evidence for Wegener's theory of Continental Drift.

By the early 1960's a number of scientists were promoting the theory that the Atlantic Ocean was in fact ever so slowly getting wider. It has now become accepted as an established fact that lava being pushed up through the ocean floor along the mid-Atlantic Ridge has been slowly pushing North America and South America away from Europe and Africa for millions of years at a rate of about one inch a year. To this day, new lava being pushed up through the mid-Atlantic Ridge

continues to force rock formations on either side of the ridge apart, leaving a permanent record of the orientation of the Earth's magnetic field as new rock is being formed. Each time the Earth's poles have reversed throughout history the newly formed rock from under water lava flows have recorded the change in the planet's magnetic poles. There is growing evidence that our planet is now entering into a new period of polar reversal. There has been a 10 % drop in the strength of the Earth's magnetic field that has been measured over the last 150 years. Scientists speculate that this could be an early sign of an impending polar reversal as shifting elements in the magnetic core begin to oppose and cancel each other out thus weakening the overall strength of the planet's magnetic field. There has also been a noteworthy increase in movement of the North magnetic pole in recent years. Although the Earth's geographic North and South poles remain unchanged, the North magnetic pole has been documented

as moving at the rate of almost 40 miles a year over the last decade. At its present rate of movement the North Pole could be situated over Russia within the next 50 years. This had been foreseen as far back as 1932 when Cayce was asked what kind of upheavals could be expected in '36; he replied "upheavals in the interior of the earth, and the shifting of same by the differentiation in the axis as respecting the positions from the Polaris center." (5748-6) Here Cayce refers to the Earth's "Polaris center", Polaris being the North Star. In other words, the magnetic core was going to begin shifting in relation to the planet's axis. Scientists estimate that a polar reversal could take hundreds if not thousands of years to complete. It's hardly surprising then that the shift that Cayce foresaw beginning in 1936 has only started to become apparent to those of us living on the surface so many years later. It looks as though Cayce was right about our future but what about the past?

## Finding A Moment in Time

**I**f anyone had tried to find historical evidence to support the details of reading 5249-1 in the years since 1944 they would have been very disappointed. The accepted date for the Earth's last polar reversal is 780,000 years ago, which of course is long before the Atlantean period. However, this date has recently been challenged by the German Research Center for Geosciences. This research group published a report in 2012 which they based on data that was collected from Greenland ice cores. Their report documents a brief pole reversal that happened 41,000 years ago. The reversal only lasted for 440 years, which was too short an interval to leave evidence among the rocks on the ocean floor. Until last year, only Edgar Cayce had been able to detect this brief climate event that took place on the Earth some 41,000 years ago! This is the only documented pole reversal during the time of Atlantis but what about the other details of reading 5249-1? Do either of the other two puzzle pieces, the ice and species extinctions fit into this time period?

It has been well documented that a number of species of giant mammals survived up until the end of the last ice age 11,500 BP (before present) although

many had died out before that time. Technically speaking we are still in an ice age. There is still ice covering the Earth's polar regions. There have been periods in our planet's distant past where there were no ice covered areas on the globe at all. Scientists refer to the times of glacial advance and retreat during an ice age as glacial periods. What we commonly call the last ice age they call the last period of glaciation. During the last glacial period Canada was completely covered by glaciers and sea level was an astonishing 394 feet lower than it is today! The records show that the peak of the last glacial period happened around 25,000 years ago. Could this be the ice that Cayce was referring to? 41,000 years ago ice would have been slowly advancing south as glaciers covered more and more land but were there any extinctions during this time period? There is no way of knowing if a species that survived up until 11,500 BP had been brought to the edge of extinction at an earlier time. Scientists can only guess at how plentiful populations were. We do know, however, that studies have shown that the extinction of the giant mammals in Australia happened just before 40,000 BP and that does fit with

our time period of the last polar reversal. We can only speculate if these extinctions were connected to broader climate changes affecting mammal populations globally.

Geologically speaking this seems to have been a very significant time in our planet's history. This was also the time of the giant Campanian Ignimbrite eruption which was the largest European volcanic eruption of the last 200,000 years. There is wide speculation that the fallout from this super volcano brought about the final demise of Neanderthal man. An article on the Campanian Ignimbrite eruption published in June of 2008 in *The Journal of Human Evolution* puts the last piece of our puzzle in place with these words "Recent work has shown that an acute cooling caused by arctic ice discharge, Heinrich Event 4 (HE4), starting at ca. 40,050 BP, was soon followed by this explosive eruption". Here is the ice that Cayce spoke of! A Heinrich Event is a sudden massive release of glacial ice which sends armadas of icebergs drifting out across the North Atlantic. Marine geologist Hartmut Heinrich documented 6 such events in the Earth's glacial history. Heinrich Event 4 lasted for a period of 150 to 250 years. During this time the influx of fresh water into the Atlantic Ocean from the melting ice was equivalent to 30% of the yearly output of all the fresh water from all of the rivers in the world emptying into the Earth's oceans. The pole reversal of 41,000 BP seems to have been followed by ice that resulted in animal destruction just as Cayce had described. Could this be the actual moment in time of the first destruction of Atlantis? We will only know for sure when Egypt's Hall of Records is finally opened. In the meantime, if correct, this information poses as many questions as it answers.

## The Invasion Of Atlantis

*Continued from page 5*

Why had the Atlanteans chosen this particular time in their history to deal with the giant animals of the Earth? (see illustration of extinct animals on page 4). Wegener's Continental Drift Theory may offer some clues. There is now strong geological and fossil evidence that all of the Earth's continents had once formed one super continent named Pangaea. Pangaea eventually broke up with the Earth's continents drifting over millions of years into their present day positions around the globe. We now know that volcanic forces along the mid-Atlantic Ridge have been pushing Europe and Africa away from the Americas for millions of years. One visual proof of this is that if the map of the world is redrawn with the continents pulled back together, it is possible to show how the coastlines of these continents once fit together. An artist's illustration of the Earth before this separation will show South America and Africa joined together with the coasts of North Africa and the United States matching (see illustration on page 4). Canada and Europe fit together well with Greenland forming a wedge to the North that fits against both continents. This explains how closely related animals such as elephants and mastodons would later be found on both sides of the Atlantic. The common ancestor of the African elephant, North America's Mastodon and Eurasia's Woolly Mammoth lived on the super continent of Pangaea. Once the continents separated these animals evolved separately. This also explains why species of lions, rhinoceros, horses, bears and camels could also be found on both sides of the Atlantic in the time of Atlantis.

Summer 2013 page 6

However, Wegener's Continental Drift Theory presents a problem for students of the Cayce readings. When the continents of the world are brought back together on a map there is no place left for Atlantis. They fit together with no hole in the middle of the Atlantic where Cayce said Atlantis once stood. At first

***“All of this leads to one possible explanation for how the Atlantians brought about their own destruction. ... Cayce's words suggest that they were either targeting the animals in the places where they were entering Atlantis or they were trying to destroy the actual land bridge or bridges that were the points of access to the continent. Either way they went too far and ruptured the Earth's mantle, which in turn completely destabilized the foundation of their homeland with disastrous results.”***

glance this would seem to be proof that Atlantis never existed at all but upon reflection it may offer an explanation for what actually happened to this legendary continent so long ago. Cayce tells us that “Then, with the coming in or the raising up of Esai, with the change that had come about, began in that period when there were the invasions of this continent by those of the animal kingdoms.” (364-4) This implies that these animals were not native to Atlantis in the first

place yet we know that the lands on either side of the ocean had always been inhabited by giant mammals. One possible explanation for this is that Atlantis was a new land formed over millions of years by the lava flows of the mid-Atlantic ridge after Africa and North America drifted apart. If Atlantis had been part of the original continent of Pangaea it would have been inhabited by the animal life of Pangaea, but it wasn't.

Atlantis may have had more in common with Iceland than it ever did with the lands that surrounded it on either side of the Atlantic. Iceland had never been part of Pangaea but was formed by the volcanoes of the mid-Atlantic ridge after the super continent broke up. As a result, Iceland was not populated by the same animal life as Europe or North America. The Arctic fox was the only indigenous land mammal found on Iceland prior to the arrival of humans. We know from Cayce's description that Atlantis was much larger than Iceland. It may have started forming in an earlier time than its northern neighbor. That would have allowed more time for birds and animals to populate the island. Still, the animal inhabitants of Atlantis were most likely to have been descended from the only creatures that had managed to survive the journey across the channels that separated it from North America and Europe. Only small animals would have been able to hitch a ride on drifting debris. Like Charles Darwin's Galapagos Islands, the flora and fauna of Atlantis may have been uniquely adapted species peculiar to this island continent. Atlantis was almost certainly free of the giant predators that over ran its nearest neighbors, that is, until the invasions began.

*Continued on page 7*

Continued from page 6

41,000 years ago the peak of the next glacial period was 16,000 years in the future yet much of Europe and Canada were already buried under glaciers. Sea levels were dropping as more and more water was being locked away in mountains of ice. At the peak of this glacial period the ocean would be almost 400 feet lower than modern sea level. To put that into a modern perspective, if we were to experience a drop in sea level of 330 feet in our time it would make it possible to walk to Newfoundland from Nova Scotia. However, 41,000 BP was not the peak of the glacial period but it was a time when sea levels were dropping. This opens the possibility that the cause of the invasion of Atlantis by "those of the animal kingdom" was the appearance of a land bridge between Atlantis and Europe or North America brought about by declining sea levels. There is an abundance of evidence showing that a land bridge formed in the Bering Strait joining Siberia and Alaska in the same time period. A land bridge could also have been formed by rising land that had been displaced by the enormous weight of the ice fields covering adjacent lands. Either way the Atlanteans were now facing a problem that they knew was only going to get worse. Cayce referred to "the coming in or the raising up of Esai". Was Esai a person or was it a place? Could it have been the name given to a newly formed isthmus of land?

All of this leads to one possible explanation for how the Atlanteans brought about their own destruction. Cayce refers to "those elements that would produce destructive forces, as might be placed in various quarters or gathering places of those beasts." (364-6) Cayce's words suggest that they were either targeting the animals in the places where they were entering Atlantis or they were trying to destroy the actual land bridge or bridges that were the points of entry to the continent. Either way they went too far and ruptured the Earth's mantle, which in turn completely destabilized the foundation of their homeland with disastrous results. Geological records show that they unleashed a force so powerful that it temporarily

reversed the Earth's magnetic poles, brought a landslide of ice pouring into the North Atlantic and set off the giant Campanian Ignimbrite eruption burying much of Europe in volcanic ash.

All of this of course is speculation. We won't know the actual history of Atlantis until the Hall of Records is opened. However, these speculations may offer an explanation for one of the more perplexing aspects of Cayce's history of Atlantis. Cayce tells us that the Atlanteans were more advanced than our present civilization and yet from what we know about them they did not dominate the planet the way that we currently do. In the Atlantean time high civilizations in some areas of the world existed along with "cave men" in others areas. In our time man has colonized every corner of the globe. The more technologically advanced cultures have dominated and colonized more primitive cultures, in effect dragging them into the modern world. The difference between their society and ours may be that the Atlanteans viewed large areas of the Earth as uninhabitable. Successful colonization of many parts of the world would have involved destroying many native species that made those areas uninhabitable for man. They may have seen it as too difficult a task or perhaps it was something that they were unwilling to do on moral grounds. In any event they did not set out to conquer the world the way modern man has. It may not be a coincidence that Lemuria, the other fabled high civilization of the ancient world was also an island. Cayce called Atlantis "the Eden of the world". Was Atlantis a gentle and safe oasis for early man, a paradise for humans amidst a wild untamed world overrun by giants? Some day we will know.

If the pole reversal of 41,000 BP was indeed the actual time of the first destruction of Atlantis then it took approximately 31,000 years from the first destruction to the last sinking. That's far longer than all of our recorded history. When Atlantis sank beneath the ocean waves it took almost 200,000 years of human history and culture with it. Along with this went a safe haven for mankind. The human race had been driven from the garden. The time had come for man to till the ground from whence he was taken.
